

Product Feedback Analyzer – Progress Report (Phase 1)

Work Completed

Today, the foundational backend of the Product Feedback Analyzer was successfully developed using Node.js, Express.js, and MongoDB. The project structure was organized into separate folders for configuration, models, controllers, routes, middleware, and services to maintain a scalable architecture.

A connection between the application and MongoDB was established using Mongoose. The Feedback data model was designed with fields such as title, description, category, status, and timestamps.

REST APIs were implemented to perform complete CRUD operations on feedback records:

- Create Feedback
- Retrieve All Feedback
- Retrieve Feedback by ID
- Update Feedback Status/Details
- Delete Feedback

All APIs were tested successfully using Postman. Feedback records were inserted, retrieved, updated, and deleted from the MongoDB database, confirming successful communication between the application and the database.

Output Achieved

- MongoDB database connection established successfully.
- Feedback collection created automatically through Mongoose.
- Complete CRUD functionality implemented and tested.
- API endpoints verified through Postman requests and responses.
- Backend architecture prepared for future enhancements such as user management, voting system, analytics, search, filtering, and Swagger documentation.

Project Status

The core backend foundation of the Product Feedback Analyzer has been completed, representing approximately 40% of the overall project. The application can now store and manage feedback data through REST APIs, providing a solid base for the remaining features and analytics modules.
